

# 38<sup>th</sup> TOCPA International Conference

28-30 March 2018, Paris, France

## Using TOC to improve capital and construction projects: Why CCPM by itself is not sufficient on projects involving significant outsourcing.

Ian Heptinstall

UK

**Marris**  
Consulting

# Capital & Construction Projects

- Represents some 8-10% of global GDP
- Over \$10 trillion spent each year
- Beset with issues & struggling to improve
- A fantastic opportunity for TOC in general and CCPM in particular to have a rapid and major impact
- ....if only it was that easy!

# Construction & Capital Projects

- Have much in common with other kinds of projects
  - It seems to be hard to achieve on-time and on-cost results

- Performance seems to be going backwards

# 82 years worth of continuous improvement

## Empire State Building 1931

102 floors  
381m  
209,000 m<sup>2</sup>

410 days to build  
\$350-600M to build  
\$2,000-3,000/m<sup>2</sup>

*Values are in \$ 2013*

## 1 World Trade Centre 2013

104 floors  
415m  
270,000 m<sup>2</sup>

3112 days to build  
\$3900M to build  
\$14,000/m<sup>2</sup>

# The Empire State Building, New York 1929-1931

## Empire State Building 1931

102 floors

381m

209,000 m<sup>2</sup>

410 days to build

\$350-600M to build

\$2,000-3,000/m<sup>2</sup>

*Values are in \$ 2013*

- Early, rapid, competence-based selection of the team
- “ECI” – Early Contractor Involvement
- Overarching team goal: Open 1 May 1931
- Off-site manufacture & modularisation
- Design for construction
- “Total Value Design”
- Focus on FLOW

# How to make projects flow

## ■ Use CCPM

- It works, is proven, and can easily be applied

## ■ BUT

- CCPM assumes there is a collaborative project team
- And that there are no substantial obstacles to collaboration

## ■ This is NOT the case in capex projects

- Fragmented team – hard to implement systemic improvements
- Especially with the way the project is procured

# The Main Barrier to collaboration

# Procurement: The Main Barrier to Collaboration

- The common forms of contract used on capital and construction projects are inherently un-collaborative in nature
- Fixed Prices, GMP, and associated penalties for breach
  - I can win, you can lose
  - Very high risk to suppliers
  - Add to the overall cost
  - Waste time because they take longer to agree, and for change to be managed
  - Incentivises conservatism and behind-the-scenes cost cutting
- Reimbursable or basic cost-plus
  - Incentivises suppliers to increase billings
  - Penalises suppliers who uncover savings and improvements
- Adding a “Partnership Charter” over the top of other contract terms adds a potential conflict
  - This can be made to work, with luck and senior-level support

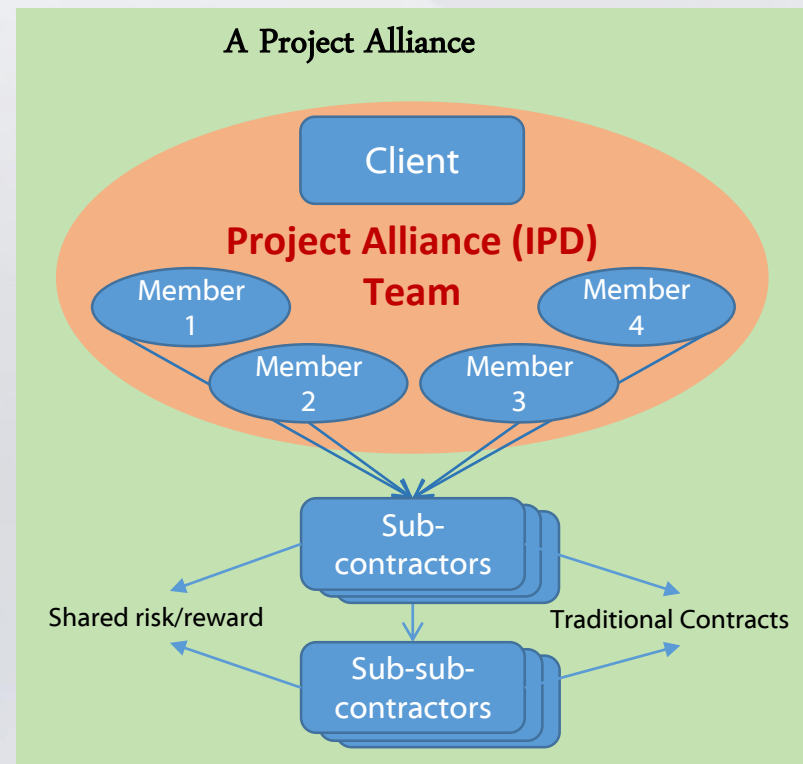

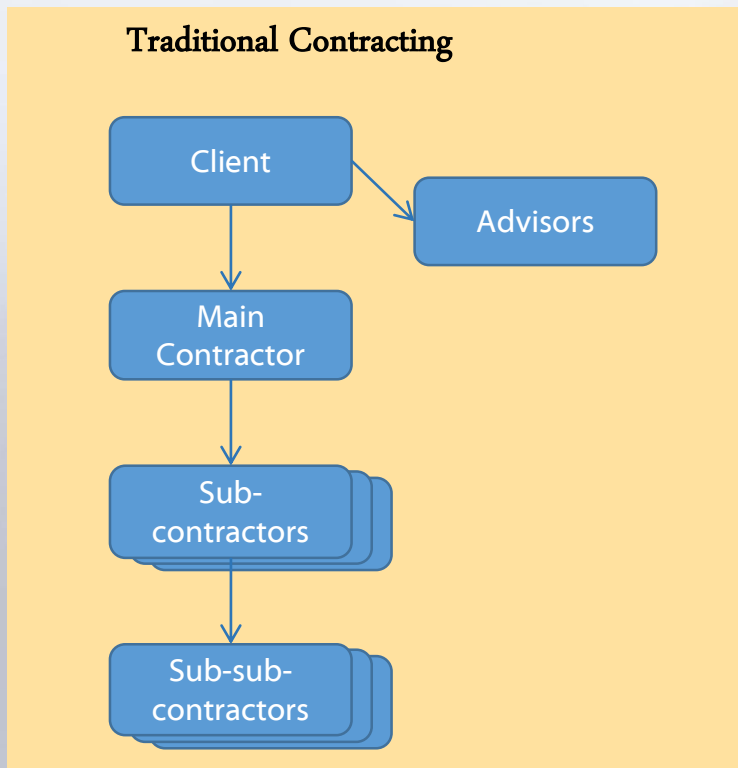

# Overcoming the Procurement Barrier to Collaboration

- Use a Project Alliance contract
  - Also known as IPD – Integrated Project Delivery
- A project alliance involves...
  - A multi-party contract, that exists only for a single project
  - Early selection and involvement
  - An integrated team – “best for project” work allocation
  - Collective sharing of risks & opportunities
  - “Fault” and “Blame” are irrelevant
  - Unanimous decision making
  - Aligned commercial interests

# The Project Alliance (Integrated Project Delivery – IPD)

- Came to prominence in the 1990's – Oil & Gas Industry
- One team – One Contract

# Payment under Project Alliance

CFV:

Cost + Fixed Fee + Variable Fee

Variable

- Linked to client project success
- Same % for all

Fixed

- Fixed in £/€/€/\$
- Not a % age
- May be zero

Cost

- “Straight-through” cash.
- No mark-up

# Using CFV Payments – The “Fix-7” Project

- A \$30M project (2016 values). Modifying an existing chemical plant
- 3-party contract: Client | Engineer & Procure | Construct
- 4 week selection for \$10M construction work
- RFP was 3 pages
- Payment using CFV method
  - Cost + Fixed Fee + Variable Fee

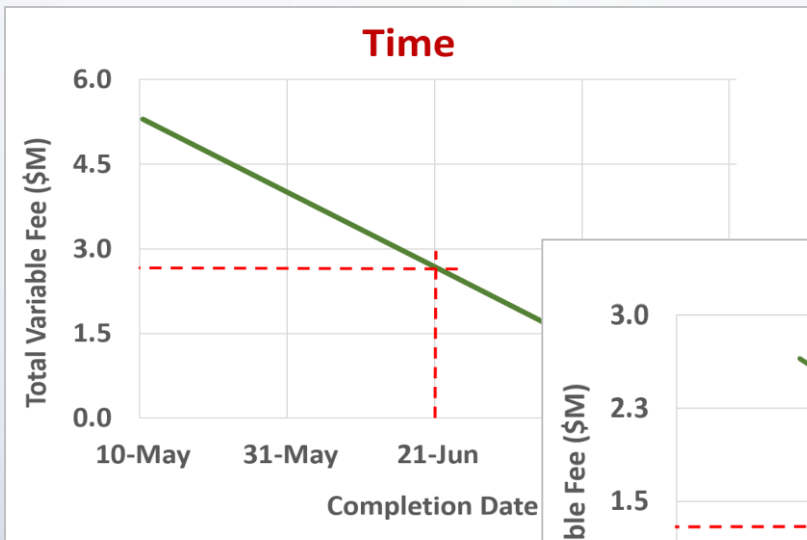

# Performance Fee Breakdown

## ■ Variable Fee – “Profit at Risk” = £300,000 total

- Co.1:       £200,000                   67%
- Co.2:       £100,000                   33%

		Nominal values	Actual Payments	
Safety	... 30%	£90,000	£180,000	
Shutdown	... 25%	£75,000	£22,850	
Schedule	... 15%	£45,000	£45,000	
Cost	... 20%	£60,000	£168,135	
Behaviour	... 10%	£30,000	£60,000	
		<hr/>	<hr/>	
		£300,000	£475,985	159%

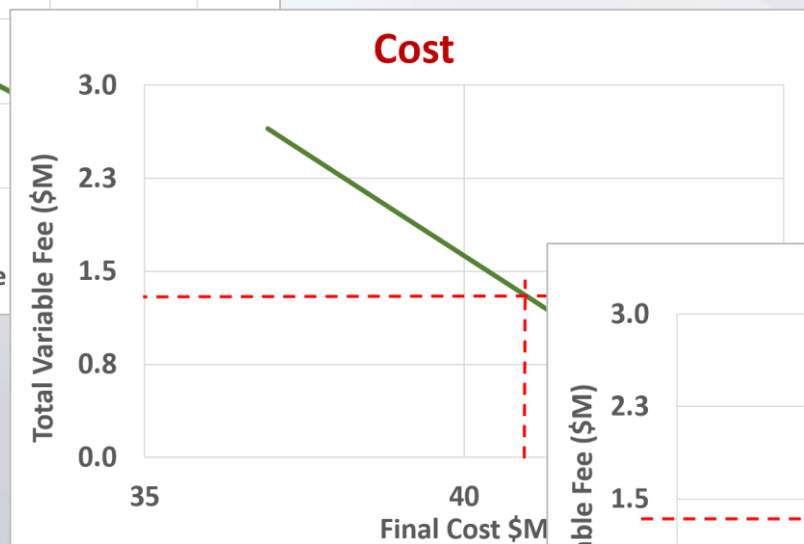

# Example Variable Fees

Customer Experience

Quality

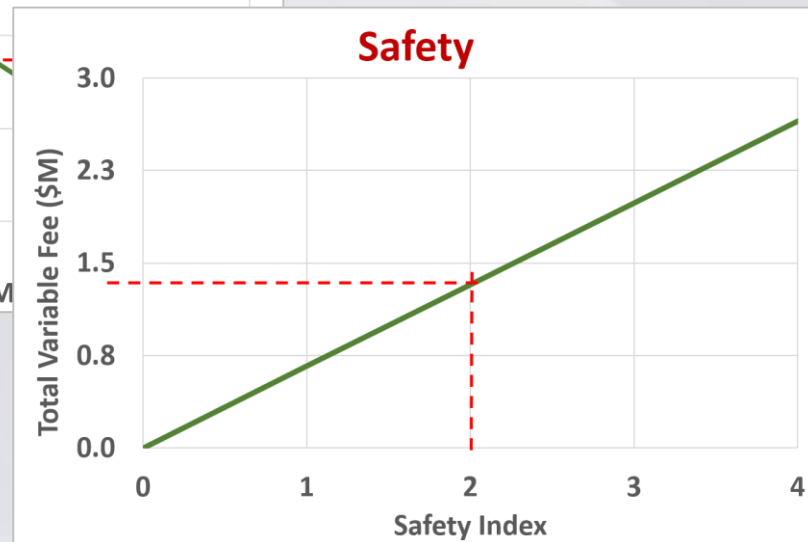

Operating Cost

Behaviours

Aesthetics

Life-cycle cost

Income/Profit/ROI

Efficiency

# CFV Payment: Cost + Fixed + Variable

- **Cost – fully reimbursed**
  - Should be just that – no margin (TVC)
  - 100% money flowing through the supply partner
- **Fixed Fee**
  - Fixed in £/\$/€, not a % of cost
  - A contribution to overheads
- **Variable Fee**
  - Each member gets a defined percentage of the performance fee pot
- **Client Changes**
  - Change the targets, F and V

## Performance Fee Pot

# A Project Alliance acts can still be competitively sourced

## Even without fixed-prices

### Traditional

- Late-as-possible selection
- Detailed bids based on scheme (Design-Bid-Build)
- Select lowest/fastest bid
- A chain selected one at a time
- Conflicting commercials

### Alliance/IPD

- Early-as-possible selection
- Outline bids based on capability (Bid-Design-Build)
- Select best available team
- A team selected together
- Aligned commercials

# A Project Alliance (IPD) gives us

- A team where all the supply members' commercial interests are aligned with each other, and the project client
- Improved focus of management attention
  - On making the project successful
  - Compared to ensure our contract is successful
- Reduced waste
  - Contract administration
  - Synchronisation & control overhead
  - Time to select
- A great platform to build from

# You get some benefit from the alliance itself

- Reduced 'policing' and 'man-marking' resources
- Reduces time-related costs from early selection
- Reduced waste in design time (design for selection)
- Improved client ROI from earlier completion
- Cost risk aggregation
- Facilitates creativity
- Though none of this is "automatic"

# Critical Success Factors

A Project Alliance/IPD is necessary...but not sufficient

## ■ Exploit the collaborative team

### - CCPM

- Same project in less time, at lower cost

### - and use value-enhancing methods & tools

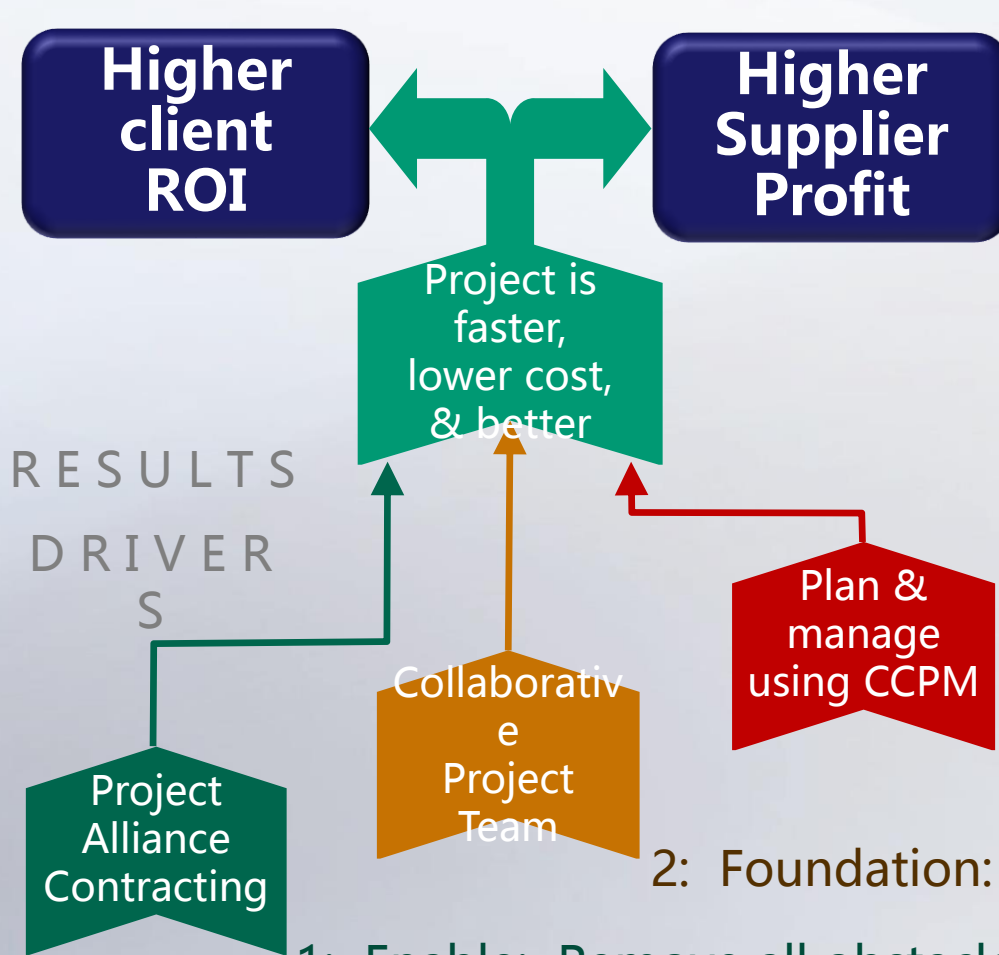

- BIM/PDMS & PIMS technologies
- Standardisation & modularisation
- Lean Construction tools
- Value-analysis & engineering
- PDRI - (Project Definition Rating Index)
- ESI/ECI - (Early Supplier/Contractor Involvement)

## ■ Lead the collaborative team

- Manage the project & the project team
- Not 'your' contract & your staff

# Breakthrough Project Management

3: Exploit: Ensure the collaborative team delivers great results

2: Foundation: Teamwork built on common goals and

1: Enable: Remove all obstacles to project team collaboration

- Ian is a specialist in capital and construction projects. He helps project teams to deliver better, faster and lower-cost projects, using a methodology developed from systems thinking and collaborative procurement.
- This approach is described in his book “*The Executive Guide to Breakthrough Project Management*”, co-written with Robert Bolton.
- Before moving into consultancy, he was Supply Chain Director for a leading construction company in the UK. Before that he spent the first 20 years of his career in a range of operations, project management and procurement roles in the chemicals and pharmaceuticals industries.
- Ian is a mechanical engineer by qualification, he is Fellow of the Chartered Institute of Procurement & Supply, and an active student of TOC.
